

Quinoline derivatives as CRTH2 antagonists

Field of the invention

The invention relates to quinoline derivatives, pharmaceutical compositions
5 containing them, processes for their preparation and their use as medicament.

Background of the invention.

In 1999, Nagata et al identified CRTH2 (chemoattractant receptor-homologous molecule expressed on Th2 cells), a novel G protein-coupled receptor
10 (GPCR) belonging to the leucocyte chemoattractant receptor family.

The CRTH2 receptor is selectively expressed from a wide variety of tissues including the brain, lung and lymphoid organs in mouse (Abe *et al.*, Gene (1999) 227 (1):71-7). With respect to expression from immune system cells, it is reported that CRTH2 receptor is selectively expressed on Th2 cells, eosinophils and basophils, but
15 not Th1 cells, B cells and NK cells in human (Nagata *et al.*, FEBS Letters (1999) 459 (2):195-9).

Bauer *et al*, (see EP1170594A2) identified Prostaglandine D₂ (PGD₂) as the endogenous ligand of CRTH2. PGD₂ is released from immunologically stimulated mast cells and Th2 cells.

20 Interaction of CRTH2 with PGD₂ plays a critical role in the allergen-induced recruitment of Th2 cells in the target tissues of allergic inflammation. In addition, CRTH2 mediates PGD₂ dependent cell migration of blood eosinophils and basophils.

Allergic asthma and allergic rhinitis are diseases that currently affect about 10% of the population, and that number appears to be increasing (Bush, R.K.a.G.,
25 John W., Handbook of asthma and rhinitis. 1st ed. (1997), Abingdon: Blackwell Science. 270). Currently numerous classes of pharmaceutical agents are widely used to treat these diseases, for example, antihistamines, decongestants, β_2 agonists, anticholinergics, methylxanthines, cromolyns, corticosteroids, and leukotriene modulators. Generally however, the usefulness of these agents is limited by side
30 effects and low efficacy. Accordingly, there is a critical medical need to identify pharmaceutically active compounds that interfere with key steps of the inflammatory and immunological processes that contribute to these disease states, and other inflammatory conditions.

Summary of the invention.

The invention relates to quinoline derivatives of general formula (I)

wherein,

- 10 - R¹ represents H, (C₁-C₄)alkyl, (C₂-C₄)alkenyl, (C₂-C₄)alkynyl or (CH₂)_m-R'¹, in which

R'¹ is selected from aromatic heterocycle, phenyl and (C₃-C₆)cycloalkyl wherein the phenyl, the heterocycle and the cycloalkyl groups are unsubstituted or substituted by one or several groups, preferably 1 to 3, selected from

- 15 - Q¹, and,
- (C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q¹,

wherein Q¹ is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹ wherein R⁹ and R¹⁰

- 20 are the same or different and are selected from H and (C₁-C₄)alkyl;

m is an integer selected from 0, 1 and 2;

-R² represents (C₁-C₄)alkyl, wherein the alkyl group may be substituted with one or several, substituents, preferably 1 to 3, selected from halogen, OR⁹, NR⁹R¹⁰, COOR⁹, C(=O)NR⁹R¹⁰, NHSO₂R⁹ and C(=O)(C₁-C₄)alkyl wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl;

-R³ represents (C₃-C₆)cycloalkyl or -A-R'³, wherein

- A represents a bond, straight or branched (C₁-C₃)alkylene, or (C₂-C₃)alkenylene;

- R'³ represents (C₆-C₁₂)aryl or an heterocycle, optionally aromatic, having from 5 to 10 atoms in the cycle, wherein the aryl and the heterocycle groups are unsubstituted or substituted by one or several substituents, preferably 1 to 3, selected from,

(C₆-C₁₂)aryl, an aromatic heterocycle,

Q², and,

(C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q²,

wherein Q² is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, SR⁹, OCH₂CF₃, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹

wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl;

- R⁴ represents H or (C₁-C₄)-alkyl;

- R⁵, R⁶, R⁷ and R⁸ are the same or different and are selected from

H, Q³, and,

(C₁-C₄)alkyl optionally substituted with one or several groups, preferably 1 to 3, which are the same or different and which are selected from Q³,

wherein Q³ is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, SR⁹, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹ wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl;

their optical isomers, as well as their N-oxides and pharmaceutically acceptable salts and their use as medicament.

The invention further concerns the use of a compound of formula (I) for the

preparation of a medicament for the prevention or the treatment of disorders for which therapy by a CRTH2 antagonist is relevant.

The invention also provides a method for the treatment of a disorder for which therapy by a CRTH2 antagonist is relevant, comprising administering to a mammal in need thereof an effective amount of a compound of formula (I).

The invention also concerns a pharmaceutical composition comprising a compound of formula (I) together with a pharmaceutically acceptable carrier, excipient, diluent or delivery system.

The invention further relates to processes for the preparation of compounds of formula (I).

Detailed description of the invention.

The invention relates to quinoline derivatives of formula (I)

wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined in the summary of the invention.

their optical isomers, as well as their N-oxides and pharmaceutically acceptable salts and their use as CRTH2 antagonist and as medicament.

These compounds are selective CRTH2 antagonists. In man, CRTH2 is selectively expressed on immune system cells, and in particular on Th2 cells, eosinophils and basophils. CRTH2 plays a critical role in the recruitment of these cells. The compounds of the invention are useful for the prevention or treatment of disease states involving Th2 cells, eosinophils and/or basophils. In particular, the compounds of the invention are useful in the prevention and treatment of disease states involving

inflammatory components, including, without limitation, inflammatory disorders such as rheumatoid arthritis, osteoarthritis, atherosclerosis, Crohn's disease, colitis ulcerosa, inflammatory bowel disease; disorders of the skin including psoriasis, eczema, erythema, pruritis, and acne; systemic lupus erythematosus, chronic obstructive pulmonary disease, angioedema, stroke, any disease marked by reperfusion injury, graft rejection, and autoimmune diseases, allergic diseases, such as allergic asthma, atopic dermatitis, and allergic rhinitis.

The compounds of the invention are also useful as research tools that can be used to antagonize the CRTH2 receptor. For example, to determine the signaling pathway of a PGD₂ mediated effect, it is essential to find out which PGD₂ receptor is involved in said pathway. This can be achieved only if selective antagonists are available for each of the PGD₂ receptors. The compounds of the invention, which are selective CRTH2 antagonists can be used for that purpose.

Compounds of formula (I) wherein R^4 represents (C_1-C_4) alkyl, have two chiral centers, numbered C^{*1} and C^{*2} on the following formula

- 10 As each of C^{*1} and C^{*2} can have a Cahn-Ingold-prelog configuration R or S, compounds of formula (I) exist in four different forms:

$C^{*1}(R)-C^{*2}(S)$ - (CIS),

$C^{*1}(S)-C^{*2}(R)$ - (CIS),

$C^{*1}(R)-C^{*2}(R)$ (TRANS), and,

- 15 $C^{*1}(S)-C^{*2}(S)$ (TRANS).

As mentioned above, a compound of formula (I), wherein R^4 represents (C_1-C_4) alkyl, includes four diastereoisomers that can be represented by the following formula (Ia), (Ib), (Ic) and (Id):

5 wherein (Ia) and (Ib) are the cis isomers and (Ic) and (Id) are the trans isomers.

In the present application, the terms “optical isomer” include the diastereoisomers of formula (Ia), (Ib), (Ic) and (Id) and mixture thereof.

10 Preferred compounds of formula (I) are compounds of formula (Ia), (Ib) and mixture thereof.

In the above groups of compounds, the following substitutions are further preferred:

15 Preferably, R^1 represents H, (C_1-C_4) alkyl, (C_2-C_4) alkenyl, (C_2-C_4) alkynyl or $(CH_2)_m-R'^1$, wherein

R'^1 is selected from phenyl and (C_3-C_6) cycloalkyl wherein the phenyl and the cycloalkyl groups are unsubstituted or substituted by one or several groups, preferably 1 to 3, selected from

20 - Q^1 , and,

- (C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q¹, wherein Q¹ is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹ wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl;
- m is an integer selected from 0, 1 and 2;
- and R², R³, R⁴, R⁵, R⁶, R⁷ and R⁸ are as defined in the summary of the invention.

- Preferably, R¹ represents (CH₂)_m—R'¹, wherein
- 10 R'¹ is selected from phenyl and (C₃-C₆)cycloalkyl wherein the phenyl and the cycloalkyl groups are unsubstituted or substituted by 1 to 3 groups selected from OR⁹, COOR⁹ and (C₁-C₄)alkyl optionally substituted with a group COOR⁹ wherein R⁹ is selected from H or (C₁-C₄)alkyl,
- m is an integer selected from 0 and 1;
- 15 and R², R³, R⁴, R⁵, R⁶, R⁷ and R⁸ are as defined in the summary of the invention.

- Another preferred group of compounds include compounds of formula (I) wherein R¹ represents (C₁-C₄)alkyl, (C₂-C₄)alkenyl, (C₂-C₄)alkynyl or (CH₂)_m—R'¹, in which
- 20 R'¹ is selected from aromatic heterocycle and (C₃-C₆)cycloalkyl wherein the heterocycle and the cycloalkyl groups are unsubstituted or substituted by one or several groups, preferably 1 to 3, selected from
- Q¹, and,
 - (C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q¹,
- 25 wherein Q¹ is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹ wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl;
- m is an integer selected from 0, 1 and 2;
- and R², R³, R⁴, R⁵, R⁶, R⁷ and R⁸ are as defined in the summary of the invention.

- 30 Preferably R¹ represents a (C₃-C₆)cycloalkyl wherein the cycloalkyl group is unsubstituted or substituted by one or several groups, preferably 1 to 3, selected from
- Q¹, and,

- (C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q¹, wherein Q¹ is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹ wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl;
- 5 m is an integer selected from 0, 1 and 2.

Preferably, R¹ represents a (C₃-C₆)cycloalkyl, more preferably, a cyclopropyl group.

- 10 Preferably, R¹ is phenyl unsubstituted or substituted in the para position by a substituent selected from halogen, OR⁹, CH₂COOR⁹ and CH₂COOR⁹ wherein R⁹ is selected from H and (C₁-C₄)alkyl.

- Preferably, R² represents (C₁-C₄)alkyl, optionally substituted with COOR⁹ wherein R⁹ is selected from H and (C₁-C₄)alkyl.
- 15

Preferably, R² represents unsubstituted (C₁-C₄)alkyl, more preferably a methyl group.

- R³ is preferably selected from (C₃-C₆)cycloalkyl and -A-R'³, wherein
- 20 - A represents a bond, (C₁-C₃)alkylene, straight or branched, or (C₂-C₃)alkenylene;
- R'³ represents an heterocycle, optionally aromatic, having from 5 to 10 atoms in the cycle, unsubstituted or substituted by one or several, preferably 1 to 3, substituents selected from,
- 25 - (C₆-C₁₂)aryl, an heterocycle,
- Q², and,
- (C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q²,
- wherein Q² is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, SR⁹, OCH₂CF₃, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹ wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl,
- 30 with the proviso that R³ is not selected from unsubstituted thienyl or unsubstituted furanyl.

Preferably, R^3 is selected from (C_3-C_6) cycloalkyl and $-A-R'^3$, wherein

- A represents a bond, (C_1-C_3) alkylene, straight or branched, or (C_2-C_3) alkenylene;
 - 5 - R'^3 represents isoxazolyl, pyrazolyl, pyrrolyl, thiazolyl, thiadiazolyl, isothiazolyl, thiazolyl, tetrazolyl or an heterocycle, optionally aromatic, having from 6 to 10 atoms in the cycle, unsubstituted or substituted by one or several, preferably 1 to 3, substituents selected from,
 - (C_6-C_{12}) aryl, an heterocycle,
 - 10 - Q^2 , and,
 - (C_1-C_4) alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q^2 ,
- wherein Q^2 is selected from halogen, NO_2 , CN, SO_2CH_3 , $SO_2NR^9R^{10}$, OR^9 , SR^9 , OCH_2CF_3 , $COOR^9$, $C(=O)NR^9R^{10}$, NR^9R^{10} , $NR^9SO_2R^{10}$, $NR^9C(=O)R^{10}$ and $C(=O)R^9$
- 15 wherein R^9 and R^{10} are the same or different and are selected from H and (C_1-C_4) alkyl;

Preferably, R^3 is selected from $-A-R'^3$, wherein

- A represents a bond;
 - 20 - R'^3 represents isoxazolyl, pyrazolyl, pyrrolyl, thiazolyl, thiadiazolyl, isothiazolyl, thiazolyl, tetrazolyl or an heterocycle, optionally aromatic, having from 6 to 10 atoms in the cycle, unsubstituted or substituted by one or several, preferably 1 to 3, substituents selected from,
 - (C_6-C_{12}) aryl, an heterocycle,
 - 25 - Q^2 , and,
 - (C_1-C_4) alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q^2 ,
- wherein Q^2 is selected from halogen, NO_2 , CN, SO_2CH_3 , $SO_2NR^9R^{10}$, OR^9 , SR^9 , OCH_2CF_3 , $COOR^9$, $C(=O)NR^9R^{10}$, NR^9R^{10} , $NR^9SO_2R^{10}$, $NR^9C(=O)R^{10}$ and $C(=O)R^9$
- 30 wherein R^9 and R^{10} are the same or different and are selected from H and (C_1-C_4) alkyl.

Preferably, R^3 is selected from $-A-R'^3$, wherein

- A represents a bond, straight or branched (C₁-C₃)alkylene, or (C₂-C₃)alkenylene;

- R³ represents (C₆-C₁₂)aryl, preferably phenyl, unsubstituted or substituted by one or several, preferably 1 to 3, substituents selected from,

- 5 - (C₆-C₁₂)aryl, an heterocycle,
 - Q², and,
 - (C₁-C₄)alkyl optionally substituted with one or several, preferably 1 to 3, groups which are the same or different and which are selected from Q²,
 wherein Q² is selected from halogen, NO₂, CN, SO₂CH₃, SO₂NR⁹R¹⁰, OR⁹, SR⁹,
 10 OCH₂CF₃, COOR⁹, C(=O)NR⁹R¹⁰, NR⁹R¹⁰, NR⁹SO₂R¹⁰, NR⁹C(=O)R¹⁰ and C(=O)R⁹
 wherein R⁹ and R¹⁰ are the same or different and are selected from H and (C₁-C₄)alkyl.

Preferably, R³ is selected from -A-R³, wherein

- 15 - A represents a bond, straight or branched (C₁-C₃)alkylene, or (C₂-C₃)alkenylene;
 - R³ represents a phenyl, unsubstituted or substituted by 1 to 3, substituents selected from (C₆-C₁₂)aryl, heterocycle, halogen, CN, CF₃, OR⁹ and COOR⁹ wherein R⁹ is selected from H and (C₁-C₄)alkyl.

20

Preferably, R⁴ represents (C₁-C₄)alkyl, more preferably a methyl group.

Preferably R⁵, R⁶, R⁷ and R⁸ are the same or different and are selected from H, halogen and OR⁹ wherein R⁹ is selected from H and (C₁-C₄)alkyl.

25

In the following and in the foregoing text:

Halogen includes fluoro, chloro, bromo, and iodo.

Alkyl groups include straight or branched carbon chains. Examples of (C₁-C₄)alkyl groups are methyl, ethyl, propyl, isopropyl, n-butyl, isobutyl and tert-butyl.

- 30 The term alkenyl groups include straight and branched hydrocarbon radicals having at least one double bond. Examples of (C₂-C₄)alkenyl groups are ethenyl, 3-buten-1-yl and the like.

The term alkynyl groups includes straight and branched hydrocarbon radicals having at least one triple bond. Examples of (C₂-C₄) alkynyl are ethynyl, 3-butyne-1-yl, propynyl, and the like.

5 The term (C₃-C₆)cycloalkyl includes cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl.

The term heterocycle includes carbocycles, optionally aromatic, having from 5 to 10 atoms in the cycle, containing from 1 to 4 heteroatoms selected from O, S and N in the cycle. A preferred group of heterocycles includes 5 or 6-membered heterocycles containing from 1 to 3 heteroatoms selected from O, S and N.

10 Particularly preferred heterocycles are isoxazolyl, oxazolyl, thienyl, pyrazolyl, pyrrolyl, triazolyl, tetrazolyl, thiazolyl, isothiazolyl, thiadiazolyl, pyridinyl, pyrazinyl, benzo-oxadiazolyl or pyrazolo-pyridinyl, quinolinyl and quinoxalinyl.

(C₆-C₁₂)aryl is understood to refer to an aromatic carbocycle containing between 6 and 12 carbon atoms. A preferred aryl group is phenyl.

The invention further relates to the above compounds or groups of compounds as medicaments. The invention further relates to the above compounds or groups of compounds as CRTH2 antagonists.

General process for the preparation of compounds of the invention

The invention also relates to a process for manufacturing a compound of formula (I),

- 5 wherein R^1 , R^2 , R^3 , R^5 , R^6 , R^7 and R^8 are as defined in the summary of the invention and R^4 is (C_1-C_4) alkyl, said process comprising the following steps:

(1) reacting a compound of formula (1a),

- 10 wherein R^5 , R^6 , R^7 and R^8 are as defined in the summary of the invention, with sodium methoxide, in the presence of a solvent such as methanol, to give the compound of formula (1b),

in which R^5 , R^6 , R^7 and R^8 are as defined above;

(2) reacting said compound of formula (1b) with a compound of formula $R^4\text{-MgCl}$, wherein R^4 is $(C_1\text{-}C_4)\text{alkyl}$ in an anhydrous ether such as tetrahydrofuran and then with benzylchloroformate, to give the compound of formula (1c),

5 in which R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

(3) reacting said compound of formula (1c) with a compound of formula $R^1\text{-NH}_2$, wherein R^1 is as defined in the summary of the invention, in the presence of a base and of $TiCl_4$ to give the compound of formula (1d),

10

in which R^1 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

(4) reducing said compound of formula (1d), using for example $NaBH_4$ and MeOH in the presence of acetic acid, to give the compound of formula (1e),

in which R^1 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

- (5) reacting said compound of formula (1e) with a compound of formula R^2COCl ,
 5 wherein R^2 is as defined in the summary of the invention, in the presence of a base, to
 give the compound of formula (1f),

in which R^1 , R^2 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

- 10 (6) deprotecting said compound of formula (1f) by hydrogenolysis, using for example
 ammonium formate catalyzed by palladium on charcoal, to give the compound of
 formula (1g)

(1g)

in which R^1 , R^2 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

(7) reacting said compound of formula (1g) with $R^3\text{COCl}$, wherein R^3 is as defined in
 5 the summary of the invention, in the presence of a base, to give a compound of
 formula (I) wherein R^1 , R^2 , R^3 , R^5 , R^6 , R^7 and R^8 are as defined above R^4 is (C_1 -
 C_4)alkyl,

(8) isolating said compound of formula (I), or,
 10

(9) separating compounds of formula (Ia) and (Ib)

from compounds of formula (Ic) and (Id)

and,

- isolating said compounds of formula (Ia) and (Ib) and compounds of formula (Ic) and (Id), or
- further separating compounds of formula (Ia) and (Ib) and compounds of formula (Ic) and (Id) to obtain four separated diastereoisomers and isolating them.

- 10 The invention also relates to a process for manufacturing a compound of formula (Ia) or (Ib) or a mixture thereof,

wherein R¹, R², R³, R⁵, R⁶, R⁷ and R⁸ and R⁴ is (C₁-C₄)alkyl, said process being

- 15 characterized in that a compound of formula (1d)

wherein R^1 , R^5 , R^6 , R^7 and R^8 are as defined in the summary of the invention and R^4 is (C_1-C_4) alkyl, is reacted with a mineral borohydride such as sodium triacetoxy borohydride in acetic acid, to give a compound *cis*-(1e) of formula

5

wherein R^1 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above.

Steps 5, 6 and 7 are then performed as disclosed in scheme 1 to give a mixture of compound of formula (Ia) and (Ib) wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above. Optionally, compounds of formula (Ia) and (Ib) may be separated and

10

The invention also relates to a process for manufacturing a compound of formula (Ia) or (Ib) or a mixture thereof,

said process being comprising the following steps,

- 5 (1) reacting a compound of formula (3a)

wherein R⁵, R⁶, R⁷ and R⁸ are as defined in the summary of the invention, with

- a compound of formula R⁴-MgCl, wherein R⁴ is (C₁-C₄)alkyl in an anhydrous ether such as tetrahydrofuran, and then with,
- a compound of formula R³-COCl,

10

to give a compound of formula (3b)

wherein R³, R⁴, R⁵, R⁶, R⁷ and R⁸ are as defined above;

- 15 (2) reacting said compound of formula (3b) with a compound of formula R¹-NH₂, wherein R¹ is as defined in the summary of the invention, in the presence of a base to give a compound of formula (3c),

wherein R^1 , R^3 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

- (3) reducing said compound of formula (3c) using for example a mineral borohydride
 5 such as sodium triacetoxy borohydride in acetic acid to give a compound of formula (3d),

wherein R^1 , R^3 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

- (4) reacting said compound of formula (3d) with a compound of formula R^2COCl ,
 wherein R^2 is as defined in the summary of the invention, in the presence of a base, to
 give a mixture of compounds of formula (Ia) and (Ib) wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 ,
 R^7 and R^8 are as defined above;
 (5) isolating said mixture, or
 15 (6) separating and isolating said compounds of formula (Ia) and (Ib).

The invention also relates to a process for manufacturing a compound of formula (Ia)
 or (Ib) or mixture thereof,

said process being comprising the following steps,

- 5 (1) reacting a compound of formula (4a)

with a compound of formula R^1-NH_2 , wherein R^1 is as defined in the summary of the invention, to give the compound of formula (4b),

- 10 in which R^1 , R^5 , R^6 , R^7 and R^8 are as defined above;

(2) reacting said compound of formula (4b), with a compound of formula R^2COCl , wherein R^2 is as defined in the summary of the invention, in the presence of a base, to give the compound of formula (4c),

in which R^1 , R^2 , R^5 , R^6 , R^7 and R^8 are as defined above;

- (3) reacting said compound of formula (4c) with benzyl-halogen in a solvent such as
 5 acetone to give the compound of formula (4d),

in which R^1 , R^2 , R^5 , R^6 , R^7 and R^8 are as defined above;

- (4) optionally, reacting said compound of formula (4d) with a compound of formula
 R^4 -MgCl, wherein R^4 is (C₁-C₄)alkyl in an anhydrous ether such as tetrahydrofuran to
 10 give the compound of formula (4e),

in which R^1 , R^2 , R^5 , R^6 , R^7 and R^8 are as defined above and R^4 is (C_1 - C_4) alkyl;

- (5) reducing said compound of formula (4d) or (4e), for example by hydrogenation in MeOH in presence (R,R)-(-)-1,2-bis[(o-methoxyphenyl)(phenyl)phosphino]ethane (1,5-cyclooctadiene)rhodium (I) tetrafluoroborate or $NiCl_2/NaBH_4$, to give a compound of formula (4f)

- in which R^1 , R^2 , R^5 , R^6 , R^7 and R^8 are as defined above and R^4 is hydrogen or (C_1 - C_4) alkyl;

(6) deprotecting said compound of formula (4f) by hydrogenolysis using for example ammonium formate catalysed by palladium on charcoal, to give a compound of formula (4g)

in which R^1 , R^2 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

(7) reacting said compound of formula (4g) with $R^3\text{COCl}$, wherein R^3 is as defined in the summary of the invention, in the presence of a base, to give a mixture compounds of formula (Ia) and (Ib) wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 , R^7 and R^8 are as defined above;

(8) isolating said compounds of formula (Ia) and (Ib), or,

10

(9) separating compounds of formula (Ia) and (Ib) and isolating them.

Depending of their substitution, compounds of formula (I) may have further chiral centers. Optical isomers due to said further chiral centers are included within the scope of the invention.

15

The compounds utilized in the invention include pharmaceutically acceptable derivatives of compounds of formula (I) such as solvates, hydrates, pharmaceutically acceptable salts and polymorphs (different crystalline lattice descriptors).

20 Pharmaceutically acceptable salts of a compound of formula (I) include salts having a basic part and salts having an acidic part.

The expression pharmaceutically acceptable salt of a compound of formula (I) having a basic part should be understood to refer to the addition salts of the compounds of formula (I) which may be formed from non-toxic inorganic or organic acids such as, for example, hydrobromic, hydrochloric, sulfuric, phosphoric, nitric, acetic, succinic, tartaric, citric, maleic, hydroxymaleic, benzoic, fumaric and toluenesulfonic acid salts, and the like. The various quaternary ammonium salts of the derivatives (I) are also

25

included in this category of compounds of the invention. In addition, the expression pharmaceutically acceptable salt of a compound of formula (I) having an acidic part is understood to refer to the usual salts of the compounds of formula (I) which may be formed from non-toxic inorganic or organic bases such as, for example, the hydroxides of alkali metals and alkaline-earth metals (sodium, potassium, magnesium and calcium), amines (dibenzylethylenediamine, trimethylamine, piperidine, pyrrolidine, benzylamine and the like) or alternatively quaternary ammonium hydroxides such as tetramethylammonium hydroxide. (See also "Pharmaceutical salts" by Berge S.M. *et al.* (1997) J. Pharm. Sci. 66: 1-19, which is incorporated herein by reference.).

Use of a prodrug of a compound of the invention such as it would occur to one skilled in the art (see Bundgaard, *et al.*, Acta Pharm. Suec., 1987; 24: 233-246), is also contemplated.

Pharmaceutical compositions.

The products of the invention are administered in the form of compositions, which are appropriate for the nature, and severity of the complaint to be treated. The daily dose in humans is usually between 1 mg and 1 g of product, which may be taken in one or more individual doses. The compositions are prepared in forms which are compatible with the intended route of administration, such as, for example, tablets, coated tablets, capsules, mouthwashes, aerosols, powders for inhalation, suppositories, enemas, foams (such as rectal foams), gels or suspensions. These compositions are prepared by methods which are familiar to those skilled in the art and comprise from 0.5 to 60% by weight of active principle (compound of the invention) and 40 to 99.5% by weight of a pharmaceutical vehicle or carrier which is appropriate and compatible with the active principle and the physical form of the intended composition.

Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories. A solid carrier can be one or more substances which may also act as diluents, flavouring agents, solubilizers, lubricants, suspending agents, binders, or tablet disintegrating agents; it can also be an encapsulating material. In powders, the carrier is a finely divided solid, which is in a mixture with the finely divided active component. In tablets, the active component is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. The powders, tablets, cachets or

encapsulated forms for capsules preferably contain 5% to about 70% of the active component. Suitable carriers are magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter, and the like.

5 Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration. The drug may be delivered as a spray (either in a pressurized container fitted with an appropriate valve or in a non-pressurized container fitted with a metering valve).

Liquid form preparations include solutions, suspensions, and emulsions.

10 Sterile water or water-propylene glycol solutions of the active compounds may be mentioned as an example of liquid preparations suitable for parenteral administration. Liquid preparations can also be formulated in solution in aqueous polyethylene glycol solution.

15 Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavouring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical
20 formulation art.

For preparing suppository preparations, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed therein by, for example, stirring. The molten homogeneous mixture is then poured into convenient sized molds and allowed to cool and solidify. Enemas are
25 obtained according to known procedures to prepare solutions adapted for rectal administration. Foams are prepared according to known methods (these foams can notably be similar to those used to administer a drug such as 5-ASA for treating rectocolite).

Preferably the pharmaceutical preparation is in unit dosage form. In such form,
30 the preparation is divided into unit doses containing appropriate quantities of drug. The unit dosage form can be a packaged preparation, the package containing discrete quantities of the preparation, for example, packaged tablets, capsules, and powders in vials or ampoules. The unit dosage form can also be a capsule, cachet, or tablet itself, or it can be the appropriate number of any of these packaged forms.

Use

The compounds of the invention are CRTH2 antagonists, preferably selective CRTH2 antagonists. These compounds have low IC_{50} values, typically at most $10\mu M$, preferably below $1\mu M$, more preferably below $500nM$.

Compounds of the invention can be used in the prevention and the treatment of disease that can be treated by a CRTH2 antagonist such as Th2 cells-related diseases, eosinophils-related diseases and basophils-related diseases. Preferably, the compounds of the invention can be used for the prevention or the treatment of diseases involving inflammatory components including, without limitation, inflammatory disorders such as rheumatoid arthritis, osteoarthritis, atherosclerosis, Crohn's disease, colitis ulcerosa, inflammatory bowel disease; disorders of the skin including psoriasis, eczema, erythema, pruritis, and acne; systemic lupus erythematosus, chronic obstructive pulmonary disease, angioedema, stroke, and any disease marked by reperfusion injury, graft rejection, and autoimmune diseases, allergic diseases, such as allergic asthma, atopic dermatitis, and allergic rhinitis.

The invention finally relates to a method for the treatment of the above-mentioned diseases comprising administering to a mammal, particularly a human, in need thereof an effective amount of compound of the invention.

Processes for synthesizing compounds of the invention

Protocol A

Protocol A is useful for the preparation of compounds of formula (I) wherein R^4 is (C_1-C_4) alkyl.

Scheme 1 illustrates the preparation of cis isomers of compounds of formula (I) wherein R^4 is (C_1-C_4) alkyl.

Scheme 1

The starting compounds are either commercially available or can be prepared according to routes known to the skilled person.

- 5 In step 1, compound (1a), where $\text{R}^5, \text{R}^6, \text{R}^7$ and R^8 are as defined in the summary of the invention, is reacted with sodium methoxide (preferably 5-10 eq) in methanol under reflux to form the desired methoxy quinoline.

In step 2, compound (1b) is reacted with an excess of a solution of R^4 -magnesium chloride in anhydrous ether (for example tetrahydrofuran) at low temperature,

preferably between 0 and -78°C, and then treated with an excess of benzyl chloroformate in the same condition of temperature to give compound (1c).

In step 3, compound (1c) is reacted with an amine (for example aniline), a solution of titanium chloride (preferably 1 to 1.1 eq) in toluene, a base (preferably 4 to 8 eq) such as triethyl amine, in a chlorinated solvent such as dichloromethane at a temperature below 0°C to give compound (1d).

In step 4, compound (1d) is reacted with an excess of sodium triacetoxy borohydride in acetic acid at room temperature to give the desired amine (cis).

In step 5, compound cis-(1e) is acylated with an acyl chloride of formula R^2-COCl (preferably 5-30 eq) in a solvent such as dioxane or DMF and a base such as diisopropylethyl amine under reflux to give compound cis-(1f).

In step 6, compound cis-(1f) is deprotected by hydrogenolysis (for example ammonium formate catalyzed by palladium on charcoal) in an alcohol, such as ethanol, under reflux, to form compound cis-(1g).

In step 7, compound cis-(1g) is reacted with an acyl chloride (commercially available or prepared from the corresponding acid) of formula R^3-COCl , in a solvent such as dioxane, THF or DMF, and a base in solution or its solid supported form, such as diisopropylethyl amine, at room temperature to give a compound of formula (I) wherein R^4 is (C^1-C^4 alkyl).

Optionally, cis-isomers of configuration $C^{*1}(R) - C^{*2}(S)$ or $C^{*1}(S) - C^{*2}(R)$ can be separated by using methods known to the skilled man, such as flash chromatography.

Scheme 2 illustrates the preparation of a mixture of diastereoisomers of compounds of formula (I) wherein R^4 is (C_1-C_4) alkyl, starting from compound (1d) of scheme 1.

Scheme 2

Compound 1h is a mixture of 4 diastereoisomers, containing two isomers with a cis configuration and two isomers with a trans configuration. Cis isomers and trans isomers can be separated using methods known to the skilled man, such as flash chromatography.

Protocole B

- 10 Protocol B is an alternative process for the preparation of compounds of formula (I) wherein R⁴ is (C₁-C₄) alkyl. Scheme 3 illustrates the preparation of cis-isomers of compounds of formula (I).

Scheme 3

Compound (3a) is obtained according to step 1 of scheme 1.

In step 1, compound (3b) is reacted with a solution of $R^4\text{-MgCl}$ (preferably 5 to 10 eq) in anhydrous ether such as tetrahydrofuran at low temperature, preferably between 0°C and -78°C, and then treated with $R^3\text{-COCl}$ (preferably 5 to 10 eq) in the same condition of temperature to form compound (3b).

In step 2, compound (3b) is reacted with a compound of formula $R^1\text{-NH}_2$, (preferably 2 to 3 eq.), titanium chloride (preferably 1 eq) in solution in toluene, TEA (preferably 4 to 8 eq.) in a chlorinated solvent, such as dichloromethane or dichloroethane at a temperature below 0°C and stirred over night at a temperature preferably comprised between room temperature and 80°C, to give the imine derivative (3c).

In step 3, compound (3c) is reduced with a mineral borohydride (preferably 5 to 6 eq) such as sodium triacetoxyborohydride, in acetic acid. The reaction is carried out at room temperature to form the amine (3d).

In step 4, compound (3d) is acylated with $R^2\text{-COCl}$ (preferably 1 to 6 eq), in a solvent such as dioxane or DMF, and a base such diisopropylethyl amine (preferably 1 to 3 eq) at room temperature to give the desired compound of formula (I).

A mixture of diastereoisomers of compounds of formula (I) can be obtained by replacing step 3 of scheme 3 by step 4 of scheme 2. The trans isomers can then be obtained using classical methods of diastereoisomers separation.

Protocole C

Protocol C is an alternative process for the preparation of compounds of formula (I) wherein R^4 is (C₁-C₄) alkyl or hydrogen.

Scheme 4 illustrates the preparation of cis isomers of compounds of formula (I)
5 wherein R^4 is H or (C₁-C₄) alkyl.

Scheme 4

In step 1, compounds (4a) is reacted with a compound of formula R^1-NH_2 , optionally in a solvent such as acetonitrile, preferably at a temperature between 150°C to 200°C for 0.5 to 1 hour, to form compound (4b).

5 In step 2, compound (4b) is acylated with an acid chloride of formula R^2-COCl (preferably 5 to 10 eq), in an appropriate solvent such as pyridine or dioxane with or without N-ethyl-N,N-diisopropylamine, preferably at a temperature of between 50 and 130°C to form compound (4c).

In step 3, compound (4c) is reacted with benzyle-halogene, said halogen being preferably Cl or Br, in a solvent such as acetone to obtain compound of formula (4d).

10 Step 4 is performed to obtain compounds of formula (I) in which R^4 is (C_1-C_4) alkyl. Step 4 is as disclosed in Scheme 1. Alternatively, to obtain compounds of formula (I) where R^4 is H, step 5 is performed directly after step 3.

In step 5, compound (4d) (from step 3) or compound (4e) (from step 4) is reduced into compound (4f). The reduction is preferably carried out using $NiCl_2/NaBH_4$ in 15 MeOH/THF or by hydrogenation in MeOH in presence (R,R)-(-)-1,2-bis[(o-methoxyphenyl)(phenyl)phosphino]ethane(1,5-cyclooctadiene)rhodium (I) tetrafluoroborate.

In step 6, compound (4f) is deprotected by hydrogenolysis (for example ammonium formate catalysed by palladium on charcoal) in an alcool, such as ethanol, under 20 reflux, to form compound (4g).

In step 7, compound (4g) acylated with a compound of formula R^3-COCl (preferably 5 to 10 eq), in an appropriate solvent such as pyridine or dioxane with or without N-ethyl-N,N-diisopropylamine, preferably at a temperature of between 50 and 130°C to form compound (4h).

Synthesis Examples

The following examples illustrate, without limiting it, the synthesis of particularly active compounds of formula (I) according to the invention.

30 1H - NMR spectra were recorded at 400 MHz. The residual solvent peak, usually chloroform (δ_H 7.27 ppm) or DMSO (δ_H 2.5 ppm) was used as internal shift reference. Analytical HPLC was run on a DIONEX Summit equipped with a diode array detector, using a Kromasil C-18 reversed-phase column and eluting with the

following general system: acetonitrile with 0.1% v/v of acid formic in water with 0.1 % v/v of acid formic (5:95 to 95:5 in a 13 minutes gradient). LC/MS studies were run on a Hewlett-Packard HPLC 1100 coupled to a Micromass mass spectrometer.

- 5 HPLC: the purity was obtained at 214 nm, and expressed as a percentage of areas (are of the considered peak vs total of the peak areas).

Preparation of intermediates

10 **Intermediate A**

Cis-N-(2-Methyl-1,2,3,4-tetrahydro-quinolin-4-yl)-N-phenyl-acetamide

Intermediate A corresponds to a compound of formula cis-(1g), prepared according to step 1 to 6 of scheme 1 (R^1 : Phenyl, R^2 : CH_3 , R^4 : CH_3 , R^5 : H, R^6 : H, R^7 : H, R^8 : H).

15

4-Methoxy Quinoline (compound of formula (1b))

To a solution of sodium methoxide (33g) in methanol (130ml), 4-chloroquinoline (10g) was added under stirring. The mixture was heated under reflux for 6 hours.

- After cooling, the reaction mixture was concentrated, then dissolved in
20 dichloromethane (250ml) and washed with water (250ml). The organic layer was dried over sodium sulfate. The solvent was evaporated to give a yellow oil (7.39g, 76% yield) which was not purified.

HPLC: r_T : 10.77, 97.16% purity

2-Methyl-4-oxo-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (compound of formula (1c))

- 30 To a solution of 4-methoxy quinoline (3g) in tetrahydrofuran (80 ml), under nitrogen, and under cooling at $-78^\circ C$ in an acetone-dry ice bath and under stirring, a solution of methyl magnesium chloride at 3 M/l in tetrahydrofuran was added dropwise (77 ml) for 30 minutes. The mixture was stirred for 30 minutes and then benzyl chloroformate

(32.15g) was added dropwise for 45 minutes at -78°C . The mixture was stirred at room temperature over night. The reaction mixture was hydrolyzed with methanol (200ml) and then with HCl 1mol/l (200 ml) and finally concentrated. Dichloromethane (200ml) and aqueous solution of sodium bicarbonate were added to the mixture under stirring. The separate organic layer was washed with an aqueous solution of sodium chloride (200ml). The solvent was removed under reduce pressure to give an oil, which was chromatographed in silica gel with an eluent of cyclohexane / ethyl acetate (95/5). The fractions containing the desired compound were combined and evaporated to give an oil (5.44g, 98% yield).

2-Methyl-4-phenylimino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester
15 (compound of formula (1d))

To a solution of 2-Methyl-4-oxo-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (9g), triethylamine (24.65g), aniline (5.7g) in dichloromethane (110 ml), cooled at -5°C in an ice/sodium chloride bath, a solution of titanium chloride in toluene 1 mol/l was dropwise added for 10 minutes. The mixture was stirred over night at room temperature and then washed with dichloromethane and an aqueous solution of potassium carbonate. The organic layer was separated, dried over sodium sulfate and the solvent was removed under reduced pressure to give a brown oil (16g) which was directly used in the next step.

- 20 ^1H NMR $[\text{CDCl}_3]$: δ 8.3 (m, 1H), 7.8 (m, 1H), 7.3-7.5 (m, 8H), 7.2 (m, 1H), 7.1 (m, 1H), 6.8 (m, 2H), 5.2 (dd, 2H), 5 (m, 1H), 2.75 (m, 1H), 2.55 (m, 1H), 1.15 (m, 3H).

Cis-2-methyl-4-phenylamino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester
(Compound of formula cis-(1e))

- 30 To a solution of 2-methyl-4-phenylimino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (16g) in acetic acid (450ml), sodium triacetoxymethylborohydride was added in small amounts (32.32g), under stirring, at room temperature. The reaction mixture was then stirred at room temperature for one hour and poured on 1 liter of cold water

under stirring. After precipitation, the mixture was filtered, dissolved in ethyl acetate and then, washed with water. The organic layer was separated and dried over sodium sulfate. The solvent was removed to give the crude compound (9g), recrystallised in hot cyclohexane (40ml), and then filtered at room temperature to give the desired compound (5.3g, 46.6% yield).

Cis-4-(acetyl-phenylamino)-2-methyl-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (compound of formula cis-(1f))

To a solution of cis-2-methyl-4-phenylamino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (5.3 g), diisopropyl ethyl amine (2.73g) in dioxane (31ml), anhydride acetic (7.26g) was added under stirring. The mixture was heated under reflux over night. After cooling, dichloromethane and an aqueous solution of potassium carbonate were added. The organic layer was separated, and then dried over sodium sulfate. Organic solvent was removed under reduce pressure to give the crude compound (18g). The desired compound (3.8g, 64% yield) was obtained after purification by flash chromatography on silica gel with cyclohexane/ethyl acetate (80/20) as eluent and then cyclohexane/ethyl acetate (50/50).

¹H NMR [CDCl₃]: δ 7.1-7.5 (m, 14H), 5.45 (m, 1H), 5.2 (dd, 2H), 4.45 (m, 1H), 2.2 (m, 1H), 2.05 (s, 3H), 1.3 (m, 1H), 1.1 (m, 3H).

***N*-Benzyl-(2-methyl-1,2,3,4-tetrahydro-quinolin-4-yl)-acetamide**

Intermediate B corresponds to compound of formula (1g) wherein R¹: benzyl, R²: CH₃, R⁴: CH₃, R⁵: H, R⁶: H, R⁷: H and R⁸: H.

Intermediate Cis-B (Cis-*N*-Benzyl-(2-methyl-1,2,3,4-tetrahydro-quinolin-4-yl)-acetamide) and Trans-B (Trans-*N*-Benzyl-(2-methyl-1,2,3,4-tetrahydro-quinolin-4-yl)-acetamide) were prepared as follows:

2-Methyl-4-benzylimino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (compound of formula (1d))

15 To a solution of 2-Methyl-4-oxo-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (1.00 g, 3.39 mmol), triethylamine (3.77 mL, 27.1 mmol) in dichloromethane (10 mL), cooled at 0°C in an ice/sodium chloride bath, a solution of titanium tetrachloride in toluene (3.39 mL, 1.0 M in toluene) was dropwise added for 10 minutes. Benzyl amine (0.74 mL, 3.39 mmol) was added and the mixture was stirred

20 over night at room temperature. The reaction was quenched with saturated NaHCO₃ solution (100 mL) and the mixture was extracted with ethyl acetate (3 x 200 mL). The combined organic layers were washed with brine (200 mL), dried (Na₂SO₄), filtered and concentrated to give a reddish oil (1.70 g) which was used directly in the next step.

Cis and Trans-2-Methyl-4-benzylamino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (Compound of formula (1e))

30 To a solution of 2-Methyl-4-benzylimino-3,4-dihydro-2H-quinoline-1-carboxylic acid benzyl ester (1.70 g, 3.38 mmol) in methanol (50 mL), was added sodium borohydride (2.56 g, 67.7 mmol) in small portions. The reaction was stirred overnight and then

concentrated to near dryness under vacuum. This was then diluted with a concentrated solution of potassium carbonate (50 mL) and then extracted with ethyl acetate (3 x 150 mL). The combined organic layers were washed with brine (200 mL), dried (Na_2SO_4), filtered and concentrated to give a pale yellow oil (1.34 g). This material was purified on silica gel with 15% ethyl acetate / hexane to provide two fractions:

To a solution of 4,6-dichloroquinoline (4g) in methanol (50ml) was added 1.1 eq (1.1g) of sodium methoxyde. The mixture was heated under reflux for 17 hours. After cooling, the reaction mixture was evaporated under reduce pressure, dissolved in dichloromethane (80ml) and washed with water (80ml). The aqueous layer was extracted by 80ml of dichloromethane. The organic layers were combined and dried by sodium sulfate. The solvent was evaporated to give a brown oil which was chromatographed in silicagel using CH_2Cl_2 and $CH_2Cl_2/MeOH$ 99/1 and then 98/2. The fractions containing 4-methoxy-6-chloro-quinoline (**3a**) were combined and evaporated to give a brown solid (2.5 g; yield = 63%).

To a solution of 4-methoxy-6-chloro-quinoline (2.5g) in tetrahydrofuran (60 ml), under nitrogen and under cooling at -78°C (in an acetone-dry ice bath) and stirring, a solution of methyl magnesium chloride (3 mol/L) in tetrahydrofuran was dropwise added (21.4ml) for 1 hour and then benzoyl chloride (7.5 ml) was dropwise added for 30 minutes. The mixture was stirred for 2 hours. Methanol (130 ml) and then chlorhydric acid 1 mol/L (130 ml) were added and the reaction mixture was stirred overnight. Tetrahydrofuran and methanol were evaporated under reduce pressure and the aqueous layer was extracted by dichloromethane (200 ml). After separation, the organic layer was dried by sodium sulfate, evaporated under reduced pressure and chromatographed in silicagel with dichloromethane as eluent.

The fractions containing 1-benzoyl-6-chloro-2-methyl-2,3-dihydro-1*H*-quinolin-4-one (**3b**) were combined and evaporated under reduced pressure to give a yellow solid (0.7g ; yield =18%).

To a solution of 1-benzoyl-6-chloro-2-methyl-2,3-dihydro-1*H*-quinolin-4-one (0.7g), aniline (3eq) and triethylamine (5eq) in dichloroethane (30 ml), cooled at 0°C in an ice bath, 1 eq of a solution of titanium chloride in toluene (1 mol/l) was dropwise added for 15 min. The mixture was heated at 85°C during 4H30. The mixture was washed by an aqueous solution of sodium bicarbonate. The organic layer was separated, dried over sodium sulfate and the solvent was removed under reduce pressure to give a brown oil (1g) (6-chloro-2-methyl-4-phenylimino-3,4-dihydro-2*H*-quinolin-1-yl)-phenyl-methanone (**3c**), which was not purified.

To a solution of 6-chloro-2-methyl-4-phenylimino-3,4-dihydro-2*H*-quinolin-1-yl)-phenyl-methanone (0.87 g) in glacial acetic acid (35 ml) was added in small amount

sodium triacetoxyborohydride (6eq) under stirring at room temperature. The reaction was stirred during 2 hours.

- Ice (100g) was added and the mixture was basified by an aqueous solution of sodium hydroxyde until pH 6 (1 mol/l, 200ml). The aqueous solution was extracted by dichloromethane (400ml). The organic layer was separated, dried over sodium sulfate and the solvent was removed under reduce pressure to give an amber solid. A mixture of cis/trans (6-chloro-2-methyl-4-phenylamino-3,4-dihydro-2H-quinolyn-1-yl)-phenyl-methanone (86/14) was obtained after a first chromatography on silica gel (dichloromethane).
- 10 Cis-(6-chloro-2-methyl-4-phenylamino-3,4-dihydro-2H-quinolyn-1-yl)-phenyl-methanone was obtained after a second chromatography on silica gel (cyclohexane / ethylacetate 95/5) (90 mg, yield = 10.3%).

- 15 R¹: phenyl, R²: CH₃, R³: thien-2-yl, R⁴: H, R⁵: H, R⁶: H, R⁷: H, R⁸: H.

- To a solution of N-phenyl-N-quinolin-4-ylacetamide (2g) and Nickel dichloride (7.6 mmol) in methanol, cooled at 0°C, was added sodium borohydride (20 eq). The solution was then stirred overnight, at room temperature. The solvent was removed to give an amorphous material, which is crystallized in diethyl ether. After filtration, dichloromethane was added and the solution was washed with water. The organic layer was separated and dried over sodium sulfate. The solvent was removed to obtain an amorphous material. The product was purified by chromatography on silica gel using a mixture of cyclohexane and ethyl acetate (95:5) as eluent to give a N-phenyl-N-1,2,3,4-tetrahydroquinolin-4-ylacetamide (380 mg).

Binding test

15

The binding of CRTH2 antagonists was measured using membranes prepared from CRTH2-expressing L1.2 cells. To make the membrane preparation, 10 grams of cell pellet were resuspended in 20 ml of cold 50 mM Tris HCl (pH 7.7), and homogenized three times (10 seconds each) on ice with a Polytron tissue homogenizer. The suspension was then diluted to 80 ml with the same buffer, and centrifuged at 40,000 x g for 30 min. After discarding the supernatant, the pellet was washed once with cold 80 mM Tris HCl (pH 7.7) by repeating the resuspension, homogenization, and centrifugation described above. Finally, the pellet was resuspended in 20 ml of cold 50 mM Tris HCl (pH 7.7), aliquoted, and stored at - 80°C. On the day of the assay, 25 the membranes were thawed on ice, and 25 μl was placed into each well of a 96-well microtiter plate. 5 μl of 0.5 M MgCl_2 and 10 μl of PVT-WGA scintillation proximity assay (SPA) beads (Amersham) were then added to each well and mixed thoroughly. 5 μl of the compounds to be tested were then added, followed by 5 μl of 30 nM ^3H -PGD $_2$ (200 Ci/mmol from NEN diluted 1:17) to initiate the binding reaction. The plate is then sealed and incubated at room temperature for at least 1 hour before being counted on a Wallac Microbeta Trilux scintillation counter. Non-specific binding is measured in wells containing 100 μM unlabeled PGD $_2$. Active compounds are able to

30

compete with ^3H -PGD₂ for binding to CRTH2 and are identified by a decrease in the number of cpm bound.

The compounds of the invention were tested in the above assay and were found to be active CRTH2 antagonists. The IC₅₀ values of compounds of examples 1 to 102 are

5 below 5 μM .

Actin polymerization test

Actin polymerization was assayed using an actin-specific fluorescent label, phalloidin
10 –fluorescein isocyanate conjugate, which binds polymerized actin fiber. This test can
be performed using cells such as isolated human eosinophils or isolated human TH2-
cells. The cells (preparations were resuspended at 1.1×10^6 cells/ml in RPMI 1640+
pen/strep +0.5 %FCS. The cell suspension was aliquoted (450 μl /tube) into 5 ml tube.
The cells were incubated 2 min at 37°C with the cells and then the appropriate
15 stimulus (PGD₂) was added followed exactly 25 seconds later by 500 μL of stopping
solution, which contains lysophosphatidylcholine (0.5mg/ml), PBS, 6 to 8 %
formaldehyde, and 0.2 μM NBD-phalloidin in MEOH. The tube was allowed to sit at
4°C for an hour. The tube was then centrifuged at 1400 rpm for 5 minutes. The cell
pellets were washed twice and then resuspended in 500 μl PBS. Each sample was then
20 read on a FACS Caliber instrument. Cells were gated using the forward scatter/ side
scatter data in the lymphocyte area. Responses were measured by the change in
median FL-1 fluorescence between vehicle treated cells and stimulus treated cells.
Test compounds were assayed in the presence and absence of PGD₂, and compared to
a sample containing PGD₂ alone. A compound that reduces PGD₂-induced actin
25 polymerization of CRTH2 cells is identified as a candidate CRTH2 antagonist.
